

## ASIIS Web Application v. 2.10.0.0 Release Notes

The ASIIS Web Application has been upgraded. New features include:

- Tdap vaccine – Users can now enter Tdap into their vaccine inventory and link the vaccine to administered doses. Note: Tdap is marketed under the brand names Adacel (Sanofi Pasteur, not yet released) and Boostrix (GlaxoSmithKline, on the market since June 1, 2005).
- Do any of your patients have an alias? Users can now enter a patient's alias by first and last name. This also might be used for former name, such as name changes due to marriage or adoption, or for variations on a hyphenated last name, such as Mary Smith-Jones might also come to your clinic as Mary Jones.
- The VFC Provider Profile report now allows users the option of including ineligible patients.
- A history of Varicella (Chickenpox) is now included on all patient record printouts and is visible in the vaccination view/add screen to all users.
- The patient total reports are working correctly. If you experience any problems with these reports, please contact the ASIIS technical support line. For more specific details on the Reports package, see today's News Note on "Using Standard Reports".
